

Junior Rust Dev Task — Ripple (XRPL)

Implement a small Rust **library** (no CLI) with this flow:

Part 1

1. Write a function to **send a token** (issued asset) on the Ripple Testnet from *user1* to *user2*.
- Params: *user1_secret*, *user2_address*, *issuer_address*, *currency_code*, *amount*.
2. Write a function to **verify** that *user1* sent that token to *user2*.

Part 2

3. Write a function to **sign** a transfer tx offline (produce a signed blob, but don't submit).
4. Write another function to **submit** that signed tx using a different wallet / connection.
